

Project Implementation

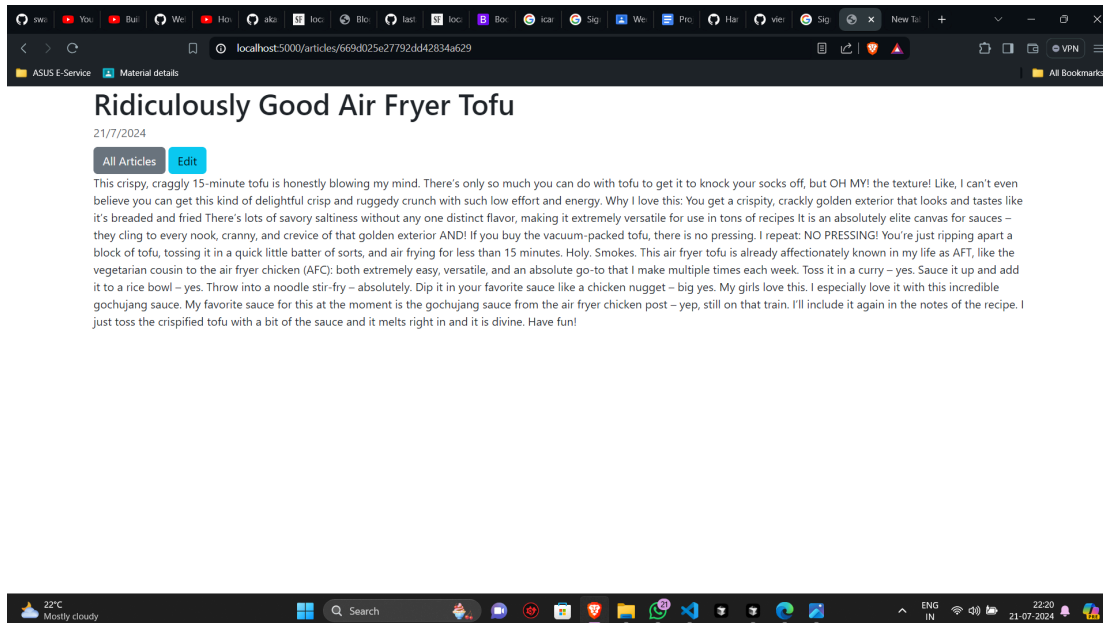

Status Phase 2

Accomplishments (July 15 - 21):

A lot of progress was made to the thought Thread blog app:

- The Blog page is now live.
- Features for creating and reading blog posts have been implemented..
- Blog posts are displayed in descending order, with the most recent posts at the top.
- MongoDB is effectively utilized for storing blog data.
- Major design elements are crafted using Bootstrap.

Plans for next week:

- Blog Delete feature to be added.
- Integrating gemini API to implement AI blog generation feature.
- Blog Edit feature to be added.
- Design Improvements.

Blocking Issues encountered:

- Adding the current date and time was a task since the `Date.now()` function was outputting jumbled strings. The task was solved using `".toLocaleDateString()"` function.
- To display newly created blogs in the home page and display them in descending order was also hard.
